

Chapter 4:Dynamics: Newton's Laws of Motion

Lecture 5

(First Sem 20/21)

The University of Jordan/Physics Department

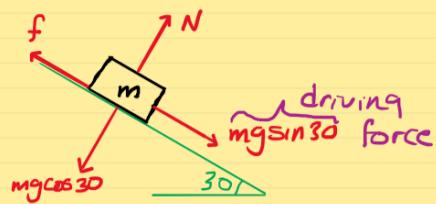

Prof. Mahmoud Jaghoub

أ.د. محمود الجاغوب

Example: In each of the following cases determine the type (kinetic or static) force of friction and its magnitude.

① $m=4\text{kg}$, $\mu_s = 0.6$, $\mu_k = 0.2$

$m g \sin 30^\circ$ is the driving force (force that acts to move the object).

NOTE: ∇^+ $N - mg \cos 30^\circ = 0$
 $\therefore N = mg \cos 30^\circ$

$m g \sin 30^\circ = 4 \times 10 \times \frac{1}{2} = 20 \text{ Newtons.}$

To determine if mass moves or not must find

$$f_{s,\max} = \mu_s N = \mu_s mg \cos 30^\circ \\ = 0.6 \times 4 \times 10 \times \frac{\sqrt{3}}{2} \approx 20.8 \text{ Newtons.}$$

$mg \sin 30 < f_{s,\max} \Rightarrow$ mass m remains stationary.

∴ The acting friction is static friction f_s .

What is the value of f_s ?

$$\nabla_+ mg \sin 30^\circ - f_s = 0$$

$$\therefore f_s = mg \sin 30^\circ = 20 \text{ Newtons.}$$

↑ static friction.

② $m = 4 \text{ kg}, \mu_s = \underline{\underline{0.4}}, \mu_k = 0.2$

$$f_{s,\max} = 0.4 \times 4 \times 10 \times \frac{\sqrt{3}}{2}$$

$$= \underline{\underline{13.9}} \text{ Newtons.}$$

$$mg \sin 30 = 20 > f_{s,\max}$$

∴ mass moves down the inclined plane \Rightarrow we have kinetic friction f_k .

$$f_k = \mu_k N = 0.2 (4 \times 10 \times \frac{\sqrt{3}}{2}) \approx 6.9 \text{ Newtons.}$$

Find the acceleration of the mass.

$$\nabla_+ mg \sin 30 - f_k = ma$$

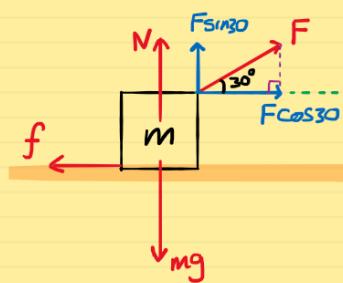

$$a = \frac{mg \sin 30 - \mu_k mg \cos 30}{m} = (\sin 30 - \mu_k \cos 30)g$$

$$\therefore a = 3.3 \text{ m/s}^2.$$

Example

In the figure: $m = 10 \text{ kg}$, $\mu_s = 0.4$
 $\mu_k = 0.3$, $F = 40 \text{ Newtons}$

(i) is the object going to move?

$f_{s,\max} = \mu_s N$, Need to find N .

$$\uparrow N + F \sin 30 - mg = 0 \quad (\text{since } a_y = 0)$$

$$N = mg - F \sin 30$$

$$N = 80 \text{ Newtons.}$$

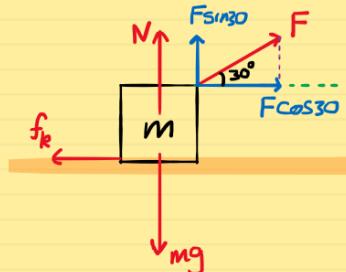

$$\therefore f_{s,\max} = 0.4 \times 80 = \underline{32} \text{ Newtons.}$$

The driving force is $F \cos 30^\circ = 34.6 \text{ N}$.

driving force

$$F \cos 30 > f_{s,\max}$$

\Rightarrow object will move
and $f \equiv f_k$ i.e. kinetic friction.

(ii) Find the acceleration of mass m (object).

(ii) Find the acceleration of mass m (object).

$$\sum F_x = ma_x$$

$$\rightarrow F \cos 30 - f_k = ma$$

$$F \cos 30 - \mu_k N = ma$$

$$F \cos 30 - \mu_k (mg - F \sin 30) = ma$$

$$\therefore a = \frac{F(\cos 30 + \mu_k \sin 30) - \mu_k mg}{m}$$

$\therefore a \approx 1.1 \text{ m/s}^2$. (along positive x-direction: a_x) -

Example:
 $m_1 = 4 \text{ kg}$, $m_2 = 2 \text{ kg}$

$$\mu_s = 0.3$$
, $\mu_k = 0.1$

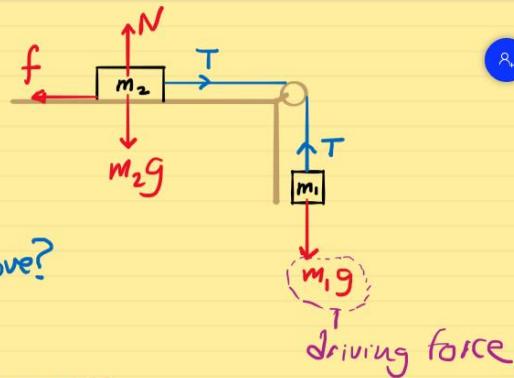

Is this system going to move?

Driving force $m_1 g$.

If $m_1 g > f_{s,\max}$ \Rightarrow system moves.

$$f_{s,\max} = \mu_s N = \mu_s m_2 g = 0.3 \times 2 \times 10 = 6 \text{ Newtons.}$$

$$(m_1 g) = 40 > f_{s,\max} \Rightarrow$$

m_1 moves down
 m_2 moves to the right and $f = f_k$

(ii) Find a and T .

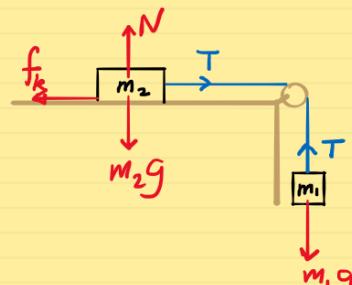

for m_1 : ↓

$$m_1 g - T = m_1 a \quad \text{--- (1)}$$

for m_2 : → +

$$T - f_k = m_2 a \quad \text{--- (2)}$$

$$\text{--- (1)} + \text{--- (2)} \Rightarrow m_1 g - f_k = (m_1 + m_2) a$$

$$\text{--- (1)} + \text{--- (2)} \Rightarrow m_1 g - f_k = (m_1 + m_2) a$$

$$\therefore a = \frac{m_1 g - \mu_k m_2 g}{(m_1 + m_2)} = \left(\frac{m_1 - \mu_k m_2}{m_1 + m_2} \right) g$$

$$\therefore a = 0.63 \text{ m/s}^2.$$

$$\text{from (1)} \quad T = m_1(g - a) \approx 37.5 \text{ Newtons.}$$

Example

33. (III) Three blocks on a frictionless horizontal surface are in contact with each other as shown in Fig. 4-54. A force F is applied to block A (mass m_A). (a) Draw a free-body diagram for each block. Determine (b) the acceleration of the system (in terms of m_A , m_B , and m_C), (c) the net force on each block, and (d) the force of contact that each block exerts on its neighbor. (e) If $m_A = m_B = m_C = 10.0 \text{ kg}$ and $F = 96.0 \text{ N}$, give numerical answers to (b), (c), and (d). Explain how your answers make sense intuitively.

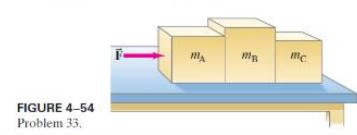

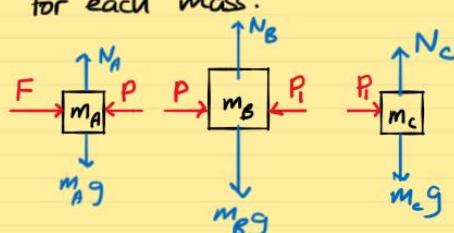

FIGURE 4-54
 Problem 33.

(a) Draw a free-body diagram for each mass.

$$\text{(b) for } m_A : \rightarrow + \quad \underbrace{F - P}_{\text{net force on } m_A} = m_A a \quad \text{--- (1)}$$

$$\text{for } m_B : \rightarrow + \quad \underbrace{P - P_1}_{\text{net force on } m_B} = m_B a \quad \text{--- (2)}$$

$$\text{for } m_C : \rightarrow + \quad \underbrace{P_1}_{\text{net force on } m_C} = m_C a \quad \text{--- (3)}$$

NOTE:
 P and P_1 are
 contact forces.

$$\textcircled{1} + \textcircled{2} + \textcircled{3} \Rightarrow F = (m_A + m_B + m_c)a$$

$$\therefore a = \frac{F}{m_A + m_B + m_c}$$

$$\text{From } \textcircled{1} \quad P = F - m_A a = F \left(1 - \frac{m_A}{m_A + m_B + m_c} \right)$$

$$\therefore P = \left(\frac{m_B + m_c}{m_A + m_B + m_c} \right) F$$

$$\text{From } \textcircled{3} \quad P_i = m_c a = \frac{m_c}{m_A + m_B + m_c} F$$

Note $P > P_i$ as P moves m_B and m_c

But P_i only moves m_c .

The lady in the figure walks forward to the right.

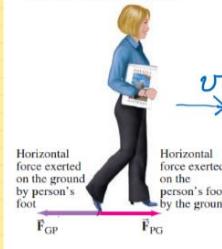

NOTE :

i) While her foot is in contact with the ground it (her foot) is stationary with respect to the ground. This means it is static friction (\vec{F}_{PG}) that acts on her foot.

ii) The lady exerts a force \vec{F}_{GP} to the left as shown. We may call this the action.

iii) The ground exerts a reaction force \vec{F}_{PG} to the right on the lady $\Rightarrow \vec{F}_{PG} = -\vec{F}_{GP}$ and they form a pair of action-reaction forces.

FIGURE 4-11 We can walk forward because, when one foot pushes backward against the ground, the ground pushes forward on that foot (Newton's third law). The two forces shown act on different objects.

iv) So when we walk forward (as in the figure) without skidding the static force of friction acts in our direction of motion. Without friction it would not be possible for us to walk.

v) If there is NO friction (smooth surface) the foot of the lady would slide backwards. On a rough surface static friction stops the foot from sliding backwards (opposes the backward motion of the foot) and hence our bodies move forward.

vi) When our foot slides (skids) forward it moves while it is in contact with the ground \Rightarrow kinetic friction acts in opposite direction to the forward sliding foot $\Rightarrow f_k$ acts backwards.

vii) When a car moves forward without skidding static friction also acts forward.

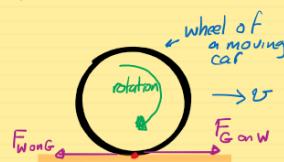

When the wheels skid forward $\Rightarrow f_k$ acts backward

Wheel of a car moving to the right.

At the instant the red point of the wheel is in contact with the ground, this point is at rest (with respect to the ground) at that instant \Rightarrow static friction acts forward.

$F_{W\text{on}G}$: force of wheel on ground (action)

$F_{G\text{on}W}$: force of ground on wheel (reaction), which is the static force of friction when the wheel does NOT skid on the ground.

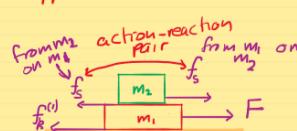

How to determine the direction of the force of friction?

Look at the surface of contact. Determine the direction of motion of the surface and draw the friction in the opposite direction.

Example

All surfaces are rough.
Determine the direction of friction forces on m_1 and m_2 .

Assume m_2 moves with m_1 .

IF no friction between m_1 and $m_2 \Rightarrow f_{21}=0$ and m_2 remains stationary while m_1 moves to the right.
