

Summary =  
Lec 8

### 3. Definitions for Acid and Base

① Arrhenius =

→ Acid = produce " $H^+$ " when dissolved in  $H_2O$ .  
→ Base = produce " $OH^-$ ".

② B.L. =

→ Acid = proton " $H^+$ " donor.  
→ Base = proton " $H^+$ " acceptor.

$$\text{Note} = [H^+] = [H_3O^+]$$

③ Lewis =

→ Acid = accept  $e^-$ .  
→ Base =  $e^-$  donor.

\* Types of Acids, depending on # of  $H^+$ :

→ monoprotic =  $HNO_3$

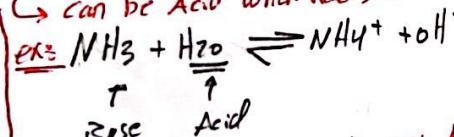

→ polyprotic

→ diprotic =  $H_2SO_4$ .

→ triprotic =  $H_3PO_4$ .

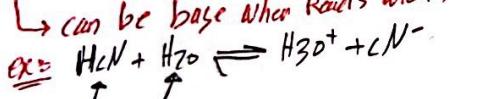

Amphoteric substance = consider neither Acid or Base  $\Rightarrow$  like  $H_2O$

→ can be acid when reacts with base

↑  
base      acid

→ can be base when reacts with acid =

↑  
acid      base

\* Note = Amphoteric + amphiphilic  
Acid OR Base      "hydrophilic" And "hydrophobic"  
"polar"      "non-polar"

Acid and Base strength  $\Rightarrow$  strong Acid and base  $\rightarrow$  dissociate 100% in  $H_2O$ .

strong Acid  $\rightarrow HCl$   $H^{+} + Cl^- \rightarrow [HCl] = [H^+] \cdot [Cl^-] \rightarrow No\ K_a$   
strong Base  $\rightarrow NaOH$   $H_2O, Na^+ + OH^- \rightarrow [NaOH] = [Na^+] \cdot [OH^-] \rightarrow No\ K_b$

→ weak Acid and base  $\Rightarrow$  dissociate partially.

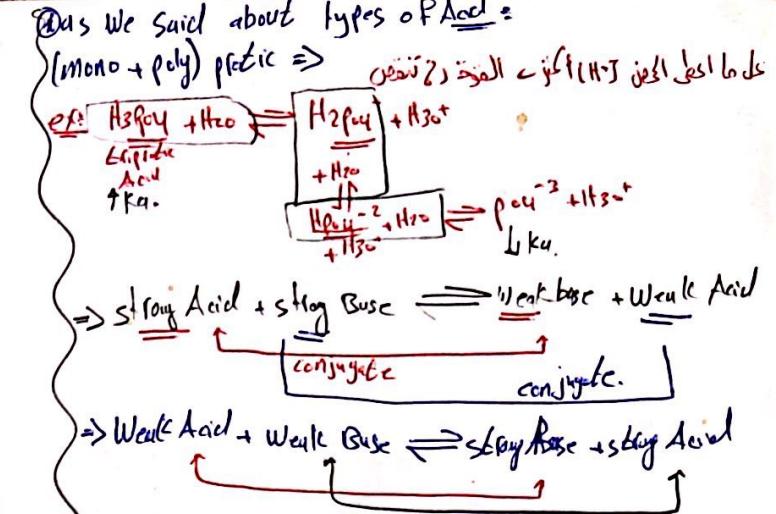

weak Acid  $\rightarrow HCN + H_2O \rightleftharpoons H_3O^+ + CN^- \rightarrow [HCN] + [\text{products}]$   
 $[H_3O^+] = [H^+] = [CN^-]$   
 $K_a = \frac{[\text{products}]}{[\text{Acid}]} = \frac{[H_3O^+]}{[HCN]}$

weak Base  $\rightarrow$

$[NH_3] + [OH^-] \quad [NH_4^+] = [OH^-]$

$K_b = \frac{[\text{products}]}{[\text{Base}]} = \frac{[OH^-]^2}{[NH_3]}$

④ Strength of acids  $\Rightarrow$  Ka  $\rightarrow$  product favored

$$K_a = \frac{[H_3O^+]}{[Acid]}$$

$$\text{pKa} = -\log K_a$$

$$pH = -\log [H_3O^+]$$
