

Carbohydrates Metabolism

Dr. Diala Abu-Hassan

Review of Carbohydrates

Digestion and absorption of carbohydrates

Suggested Readings:

- 1: Lippincott's Illustrated reviews: Biochemistry
- 2: Marks' Basic Medical Biochemistry

Carbohydrates Metabolism Topics

- \succ Utilization of Glucose \rightarrow Energy
- > Non-Carbohydrates \rightarrow Glucose
- \succ Storage of Glucose \rightarrow Glycogen
- Release of Glucose from Glycogen
- Reducing Power NADPH >> GSH
- Glucuronic acid >> Drug metabolism
- Interconversion of sugars

Sugars are either aldoses or ketoses

Examples of monosaccharides found in human

Generic names

- 3 carbons: trioses
- 4 carbons: tetroses
- 5 carbons: pentoses
- 6 carbons: hexoses
- 7 carbons: heptoses
- 9 carbons: nonoses

Examples Glyceraldehyde Erythrose Ribose Glucose Sedoheptulose Neuraminic acid

Sugars have Isomers

Epimers are isomers:

Changing the orientation of one hydroxyl group will produce a different sugar

Glucose and Fructose are isomers

Enantiomers

Alpha and Beta Sugars (Anomers)

Disaccharides

Sugars made of two monosaccharide units joined by a glycosidic bond

Glycosidic bond is cleaved by glycosidase enzyme

Digestion of Carbohydrates

Starch Digestion

Mucosal cell membrane-bound enzymes

ENZYME	Bond Cleaved	Substrates
Isomaltase	$\alpha 1 \rightarrow 6$	Isomaltose
Maltase	$\alpha 1 \rightarrow 4$	Maltose
Sucrase	$\alpha 1 \rightarrow 2$	Sucrose
Lactase	$\beta 1 \rightarrow 4$	Lactose
Trehalase	$\alpha 1 \rightarrow 1$	Trehalose
Exoglycosidase	$\alpha 1 \rightarrow 4$	Glucoamylose

Sucrase-isomaltase complex

FIG. 27.5. The major portion of the sucrase–isomaltase complex, containing the catalytic sites, protrudes from the absorptive cells into the lumen of the intestine. Other domains of the protein form a connecting segment (stalk) and an anchoring segment that extends through the membrane into the cell. The complex is synthesized as a single polypeptide chain that is split into its two enzyme subunits extracellularly. Each subunit is a domain with a catalytic site (distinct sucrase–maltase and isomaltase–maltase sites). In spite of their maltase activity, these catalytic sites are often called just *sucrase* and *isomaltase*.

Clinical Hint: Abnormal Degradation of disaccharides

1. Sucrase-isomaltase deficiency:

- Causes:
 - Genetics
 - Variety of intestinal diseases
 - Malnutrition
 - Injury of mucosa i.e by drugs
 - Severe diarrhea

Clinical Hint: Abnormal Degradation of disaccharides

2. Lactase deficiency: ½ world's population

Lactase reached maximal activity @ 1 month of age

Declines ----- >> adult level at 5 to 7 year of age

10 % of infant level

1 cup of milk (9 grams of lactose) → loss of 1 liter of extracellular fluid

Lactase deficiency

Absorption of Sugars Polar molecules can not diffuse A: Na⁺-independent facilitated diffusion transport

GLUT 1-----GLUT 14

Glc. Movement follows concentration gradient

Two conformational states

Na⁺ monosaccharide cotranspoerter system (SGLT)

• Against concentration gradient (requires energy).

• For glucose and galactose absorption

Table 27.5 Properties of the GLUT 1 to GLUT 5 Isoforms of the Glucose Transport Proteins

Transporter	Tissue Distribution	Comments
GLUT 1	Human erythrocyte Blood–brain barrier Blood–retinal barrier Blood–placental barrier	Expressed in cell types with barrier functions; a high-affinity glucose transport system
GLUT 2	Blood-testis barrier Liver	A high-capacity, low-affinity transporter
Glucose,	Kidney Pancreatic β-cell	May be used as the glucose sensor in the pancreas
and fructose	Serosal surface of intestinal (Basolateral surface)	
GLUT 3	Brain (neurons)	Major transporter in the central nervous
GLUT 4	Adipose tissue Skeletal muscle Heart muscle	Insulin-sensitive transporter to the presence of insulin, the number of GLUT 4 transporters increases on the presence of th
GLUT 5 Fructose	Intestinal epithelium Spermatozoa	cell surface; a high-affinity system This is actually a fructose transporter Na independent
GLUT 7	Glucogenic tissues	at endoplasmic reticulum membrane

Glucose transport in neural vs. non-neural cells

Insulin stimulates transport of glucose into muscle and adipose tissues

An overview of glucose metabolism
