

Cardiac output and Venous Return

Faisal I. Mohammed, MD, PhD

Objectives

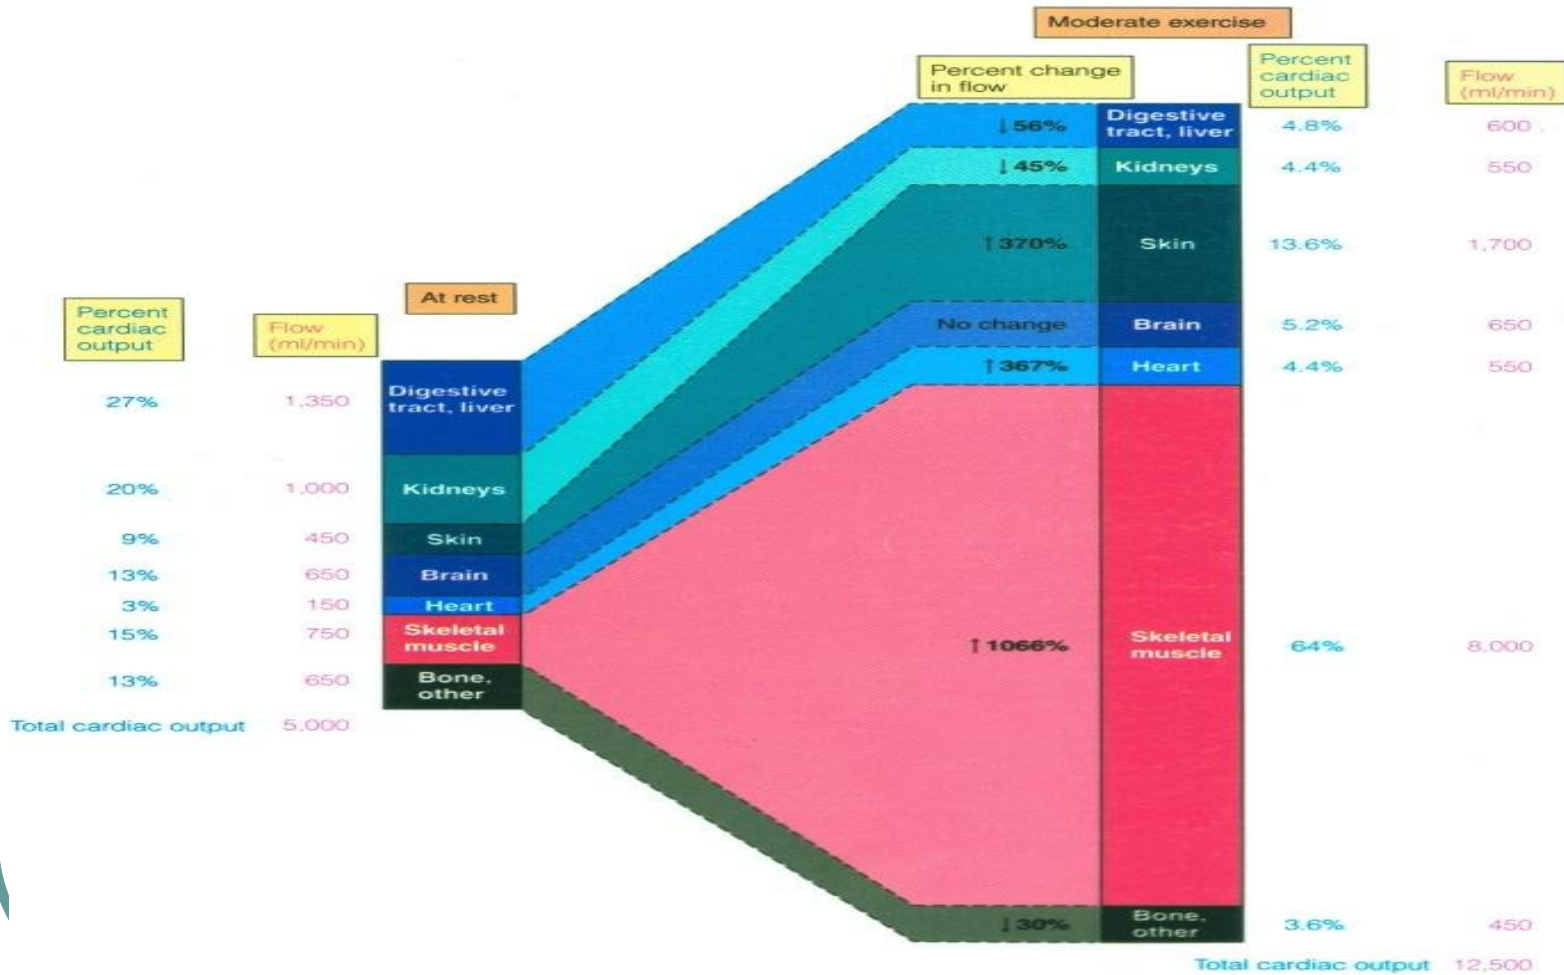

- Define cardiac output and venous return
- Describe the methods of measurement of CO
- Outline the factors that regulate cardiac output
- Follow up the cardiac output curves at different physiological states
- Define venous return and describe venous return curve
- Outline the factors that regulate venous return curve at different physiological states
- Inter-relate Cardiac output and venous return curves

Important Concepts About Cardiac Output (CO) Control

- Cardiac Output is the sum of all tissue flows and is affected by their regulation (CO = 5L/min, cardiac index = 3L/min/m²).
- CO is proportional to tissue O₂ use.
- CO is proportional to 1/TPR when AP is constant.
- $F = \Delta P / R$ (Ohm's law)
- $CO = (MAP - RAP) / TPR$, ($RAP = 0$) then
- $CO = MAP / TPR$; $MAP = CO * TPR$

Magnitude & Distribution of CO at Rest & During Moderate Exercise

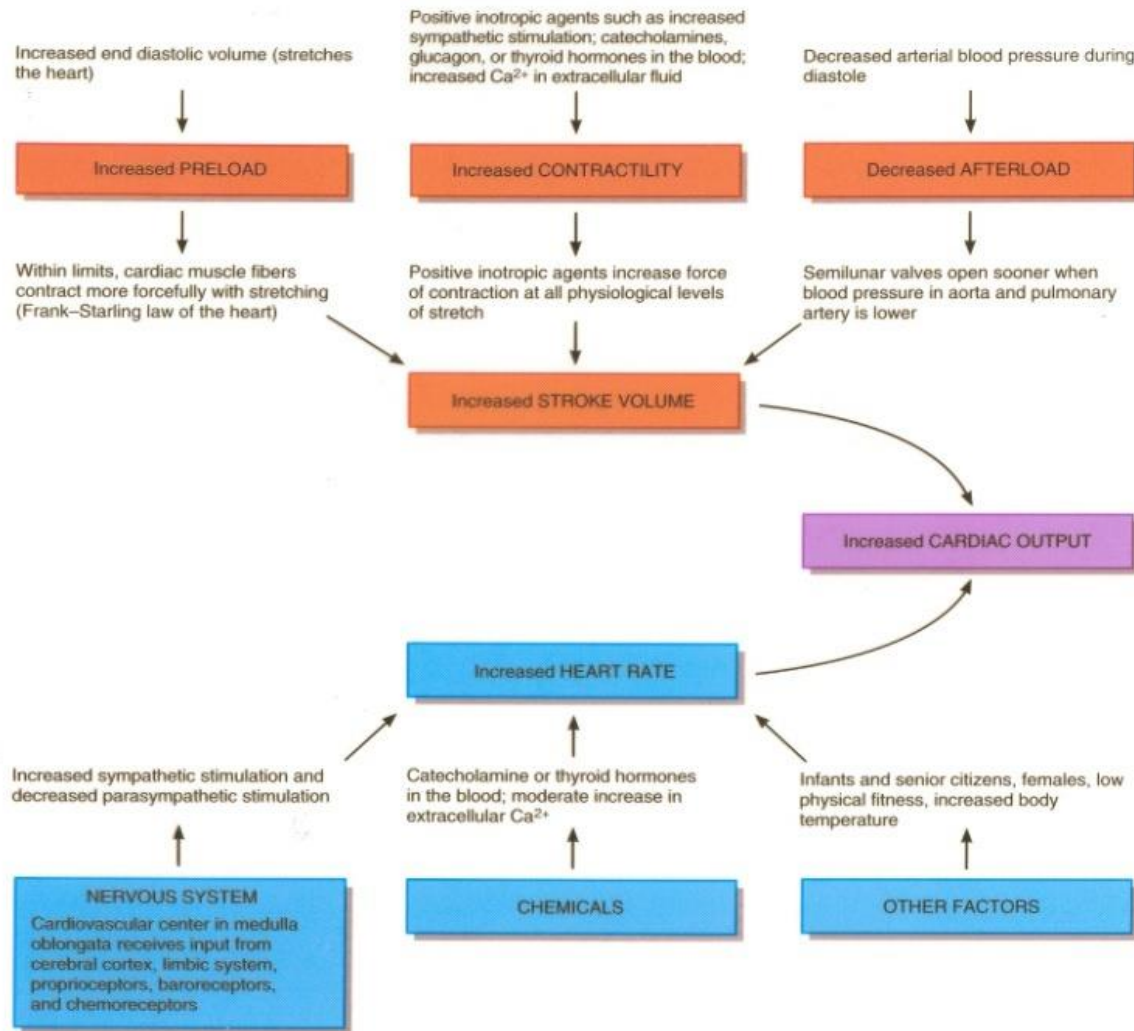

Variations in Tissue Blood Flow

	Per cent	ml/min	ml/min/ 100 gm
Brain	14	700	50
Heart	4	200	70
Bronchi	2	100	25
Kidneys	22	1100	360
Liver	27	1350	95
Portal	(21)	(1050)	
Arterial	(6)	(300)	
Muscle (inactive state)	15	750	4
Bone	5	250	3
Skin (cool weather)	6	300	3
Thyroid gland	1	50	160
Adrenal glands	0.5	25	300
Other tissues	3.5	175	1.3
Total	100.0	5000	---

Control of Cardiac Output

Factors that affect the Cardiac Output

Autonomic Effects on Heart

- ❑ Sympathetic stimulation causes increased HR and increased contractility with HR = 180-200 and C.O. = 15-20 L/min.
- ❑ Parasympathetic stimulation decreases HR markedly and decreases cardiac contractility slightly. Vagal fibers go mainly to atria.
- ❑ Fast heart rate (tachycardia) can decrease C.O. because there is not enough time for heart to fill during diastole.

Cardiac Contractility

- Best is to measure the C.O. curve, but this is nearly impossible in humans.
- dP/dt is not an accurate measure because this increases with increasing preload and afterload.
- $(dP/dt)/P_{\text{ventricle}}$ is better. $P_{\text{ventricle}}$ is instantaneous ventricular pressure.
- Excess K^+ decreases contractility.
- Excess Ca^{++} causes spastic contraction, and low Ca^{++} causes cardiac dilation.

Work of the ventricles

- During the latter part of the ejection phase how can blood still leave the ventricle if pressure is higher in the aorta? Momentum of blood flow
- Total energy of blood = $P + mV^2/2$
= pressure + kinetic energy
- Total energy of blood leaving ventricle is greater than in aorta.

Ventricular Stroke Work Output

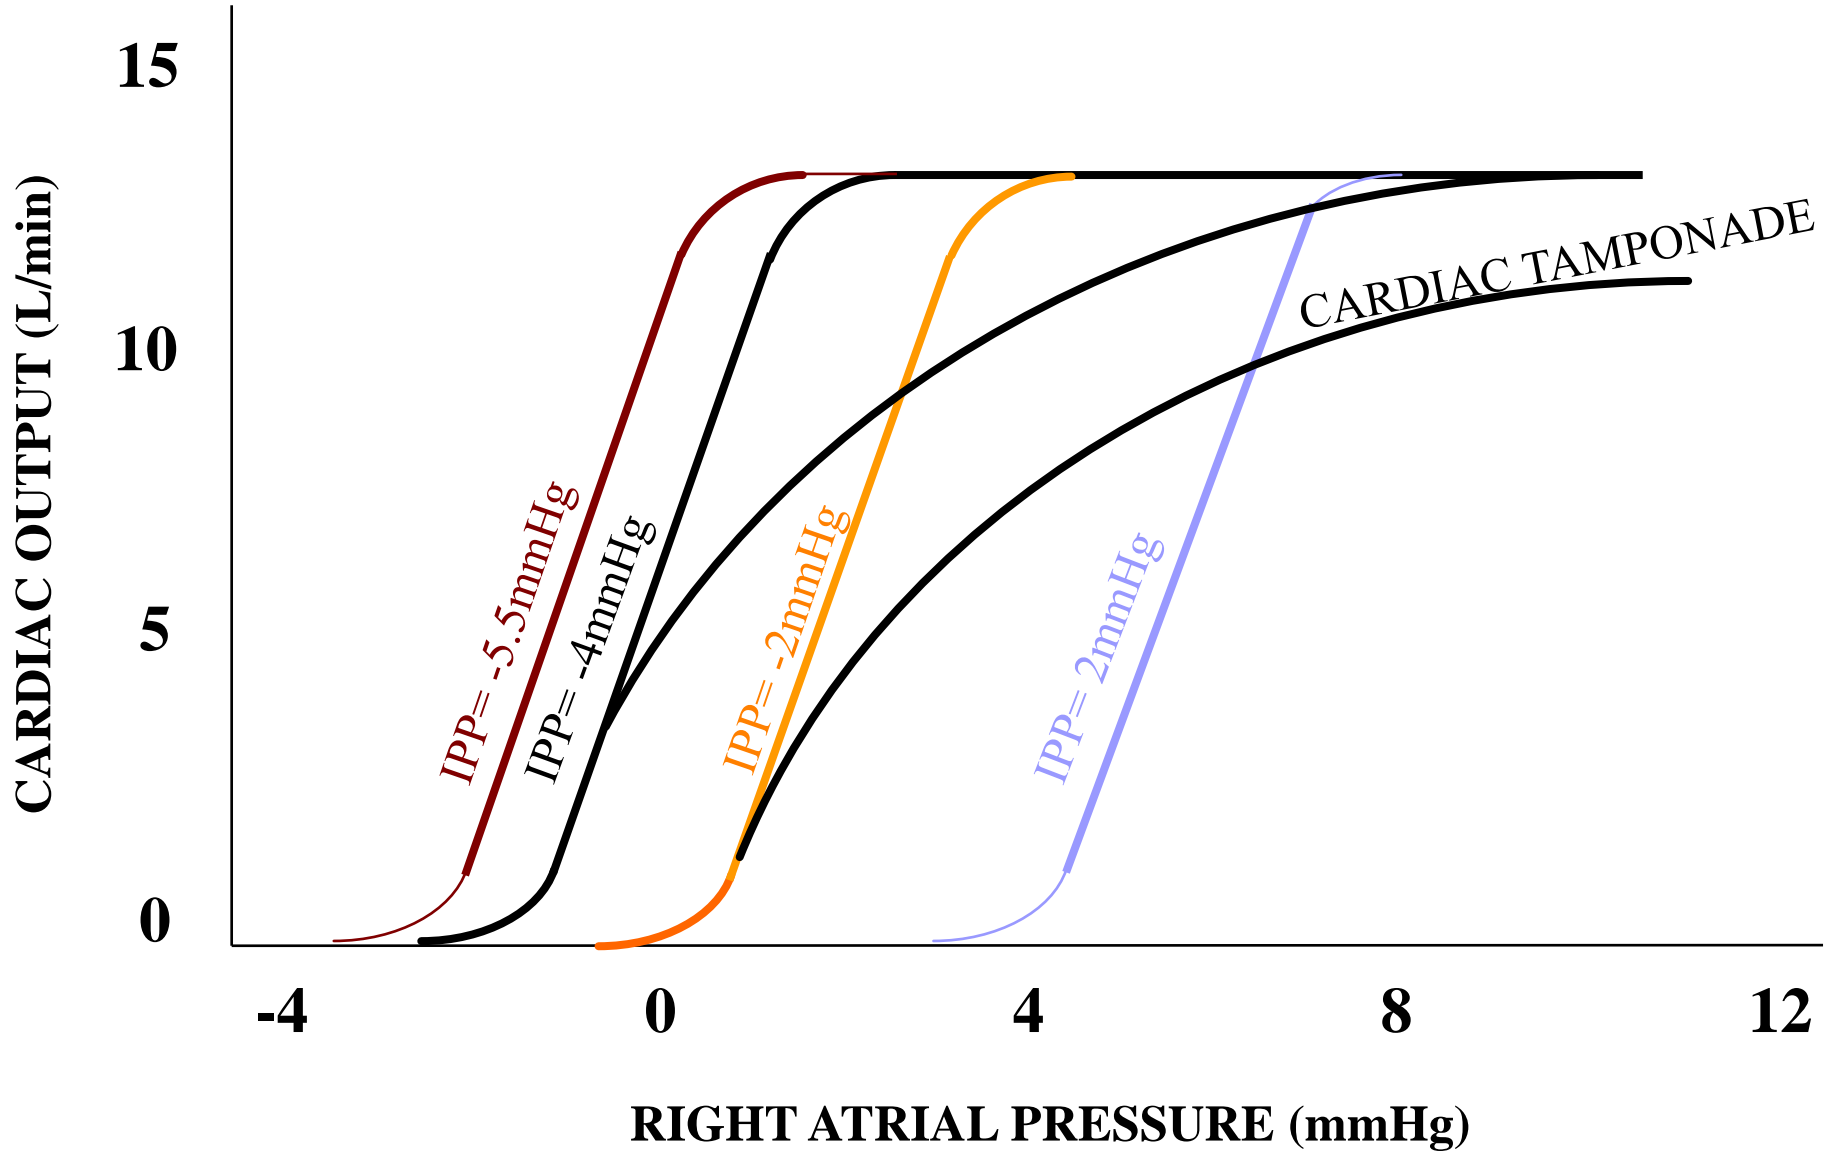

CARDIAC OUTPUT CURVES

Effect of Sympathetic and Parasympathetic Stimulation on Cardiac Output

IPP = INTRAPLEURAL PRESSURE

The Cardiac Output Curve

- Plateau of CO curve determined by heart strength (contractility + HR)
- Sympathetics \Rightarrow plateau
- \downarrow Parasympathetics (HR) \Rightarrow (? plateau)
- Plateau
- Heart hypertrophy's \Rightarrow plateau
- Myocardial infarction \Rightarrow (? plateau)
- \downarrow Plateau

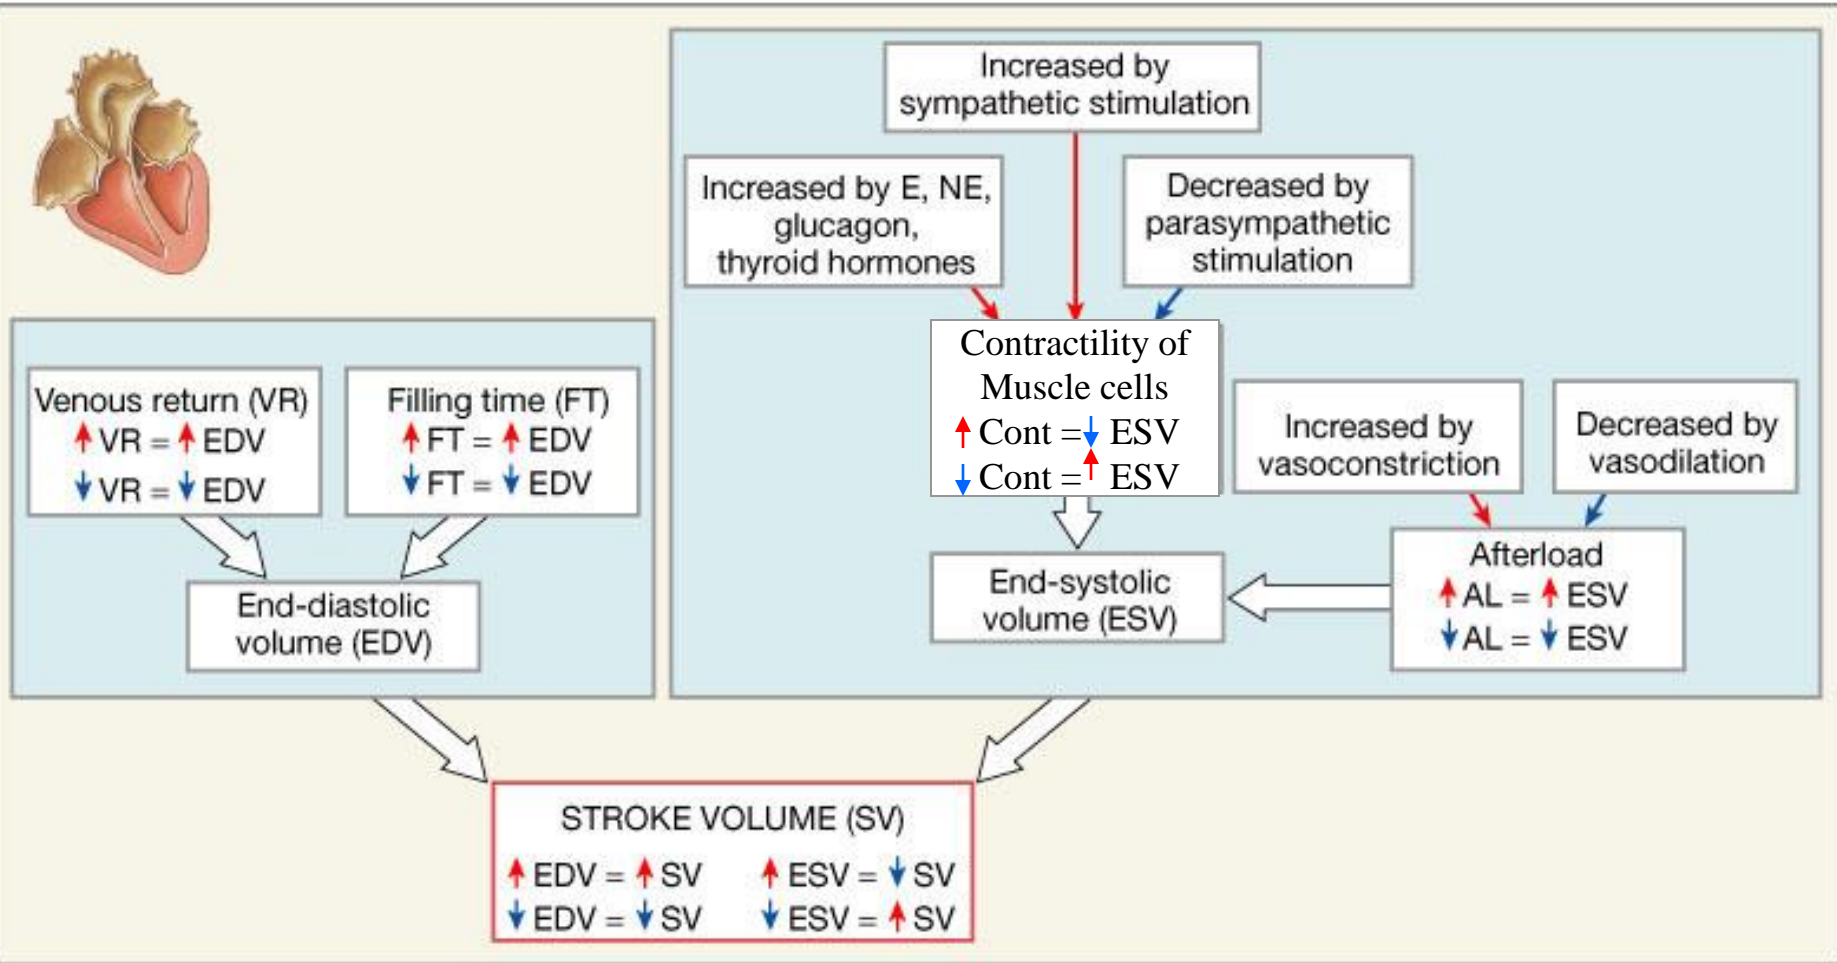

The Cardiac Output Curve (cont'd)

- Valvular disease \Rightarrow \downarrow plateau
(stenosis or regurgitation)
- Myocarditis \Rightarrow \downarrow plateau
- Cardiac tamponade \Rightarrow (? plateau)
- \downarrow Plateau
- Metabolic damage \Rightarrow \downarrow plateau

Factors Affecting Cardiac Output

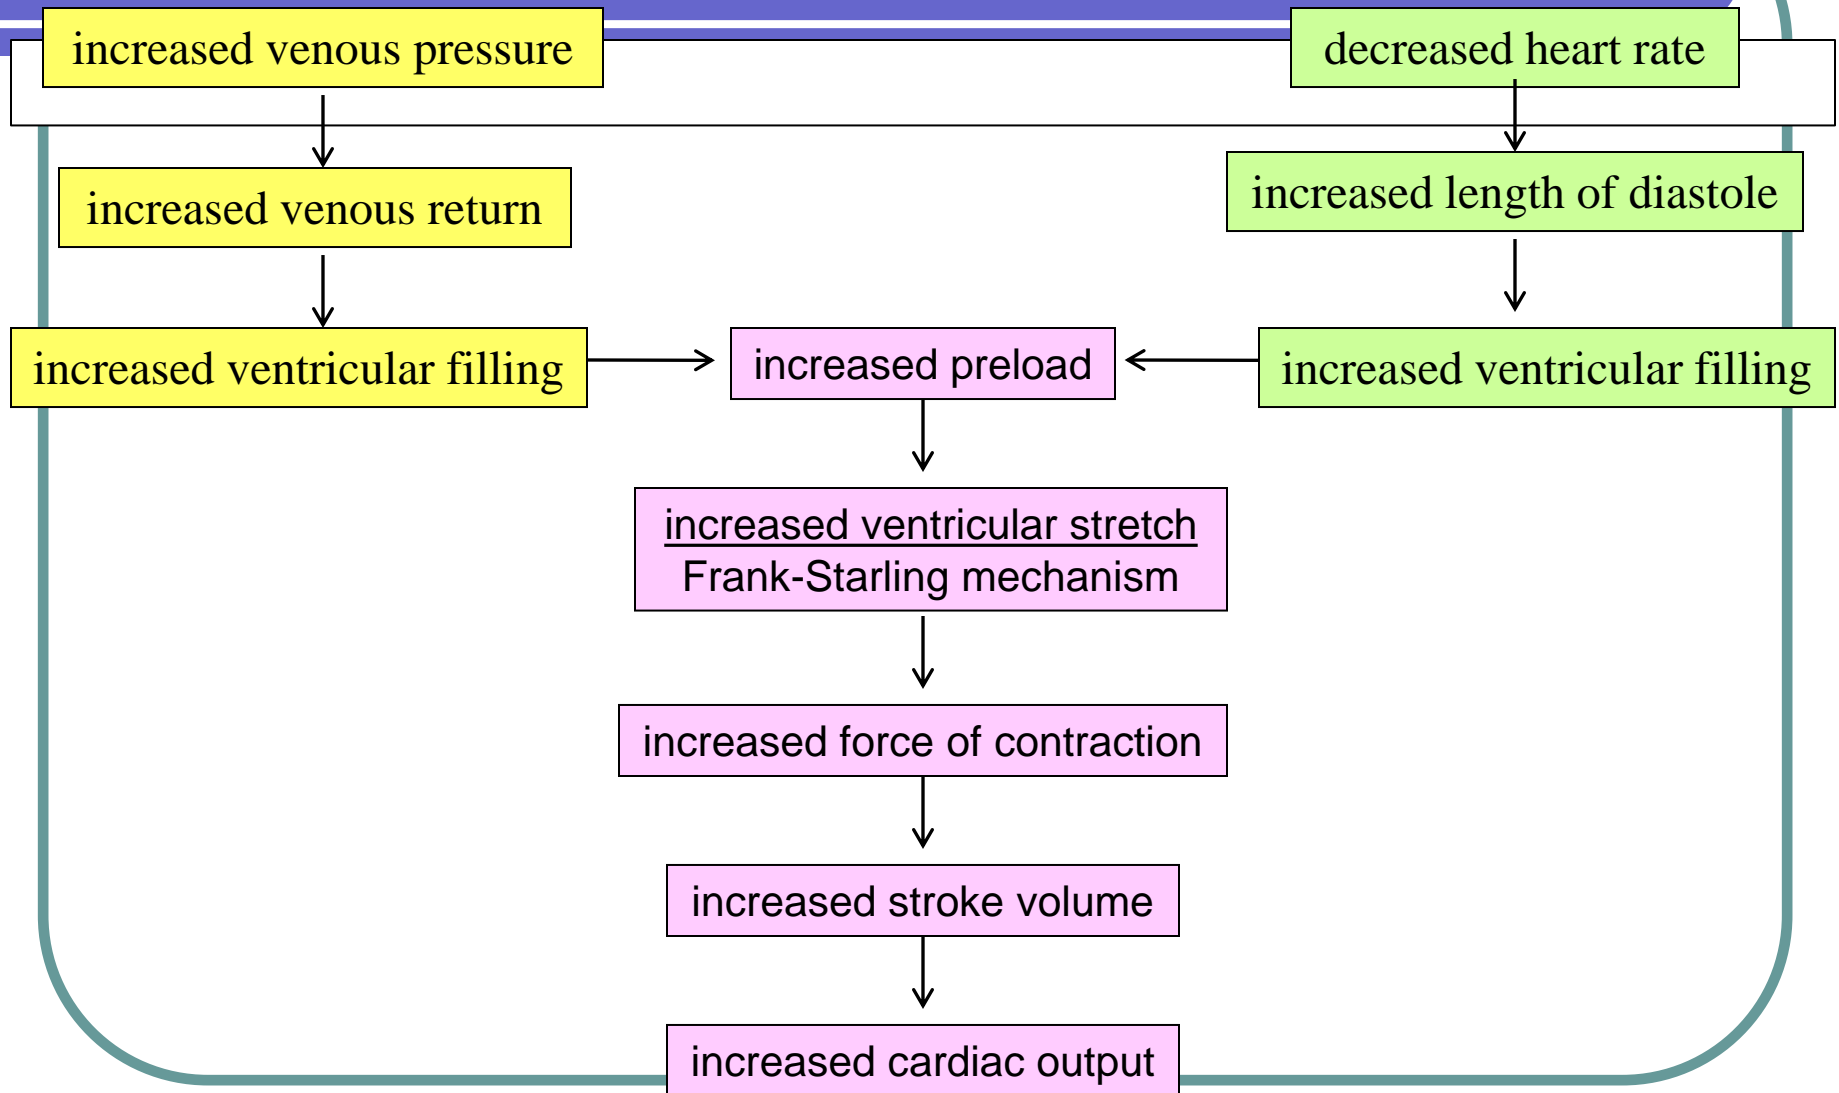

Factors Affecting Stroke Volume

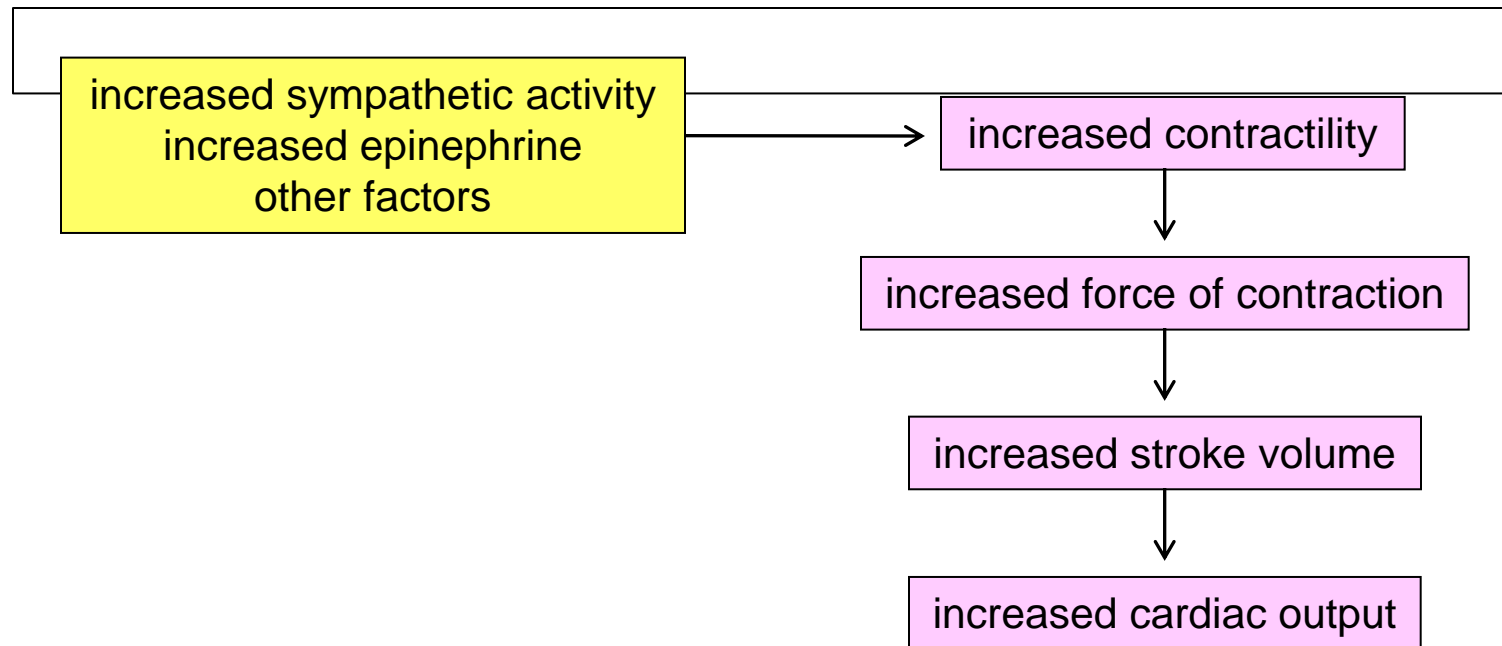

A Summary of the Factors Affecting Cardiac Output

REGULATION OF STROKE VOLUME: PRELOAD

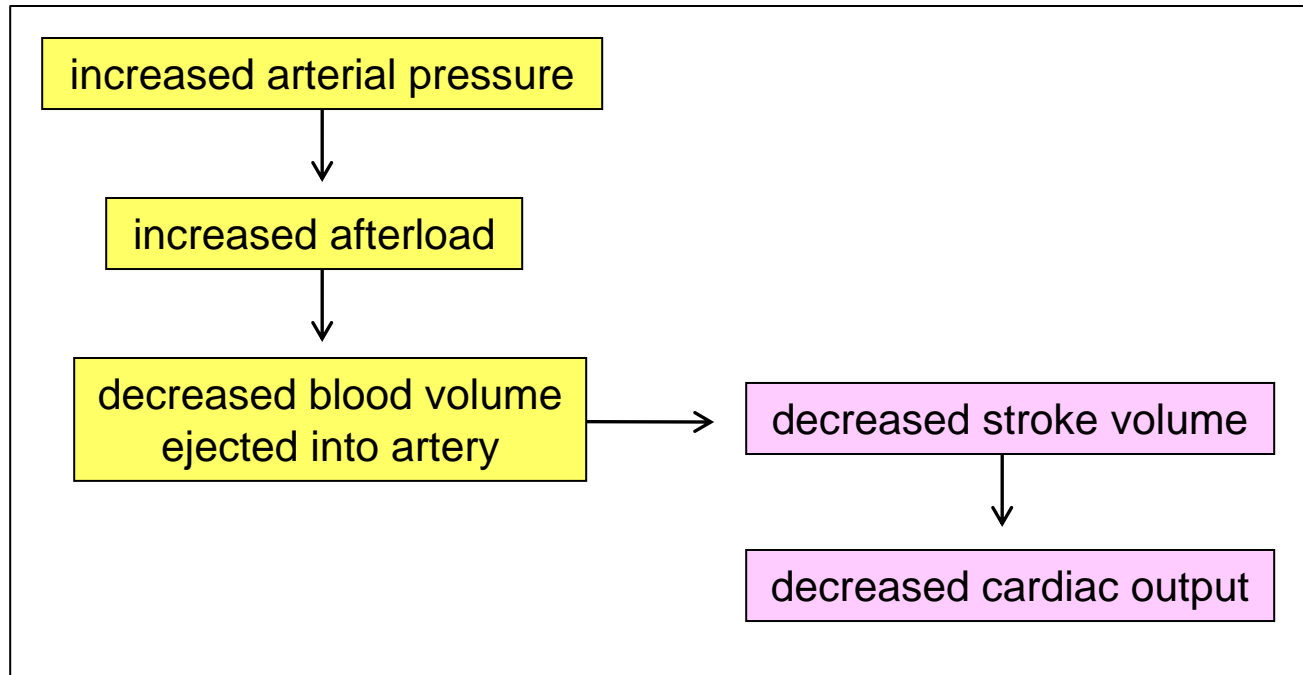

REGULATION OF STROKE VOLUME: CONTRACTILITY

Cardiac Contractility

- Best is to measure the C.O. curve, but this is nearly impossible in humans.
- dP/dt is not an accurate measure because this increases with increasing preload and afterload.
- $(dP/dt)/P_{\text{ventricle}}$ is better. $P_{\text{ventricle}}$ is instantaneous ventricular pressure.
- Excess K^+ decreases contractility.
- Excess Ca^{++} causes spastic contraction, and low Ca^{++} causes cardiac dilation.

REGULATION OF STROKE VOLUME: AFTERLOAD

Thank You

Measurement of Cardiac Output

- Electromagnetic flowmeter
- Indicator dilution (dye such as cardiogreen)
- Thermal dilution
- *Oxygen Fick Method*
- *CO = (O₂ consumption / (A-V O₂ difference))*

Electromagnetic flowmeter

$$q_1 = \dot{V}_O_2 \cdot C_{V_{O_2}}$$

q_2 = amount of Oxygen uptake by the lungs

$q_3 = \dot{V}_O_2 \cdot C_{A_{O_2}}$ and equals $= \dot{V}_O_2 \cdot C_{V_{O_2}} + O_2$ uptake

$$\text{Oxygen uptake} = \dot{V}_O_2 \{ C_{A_{O_2}} - C_{V_{O_2}} \}$$

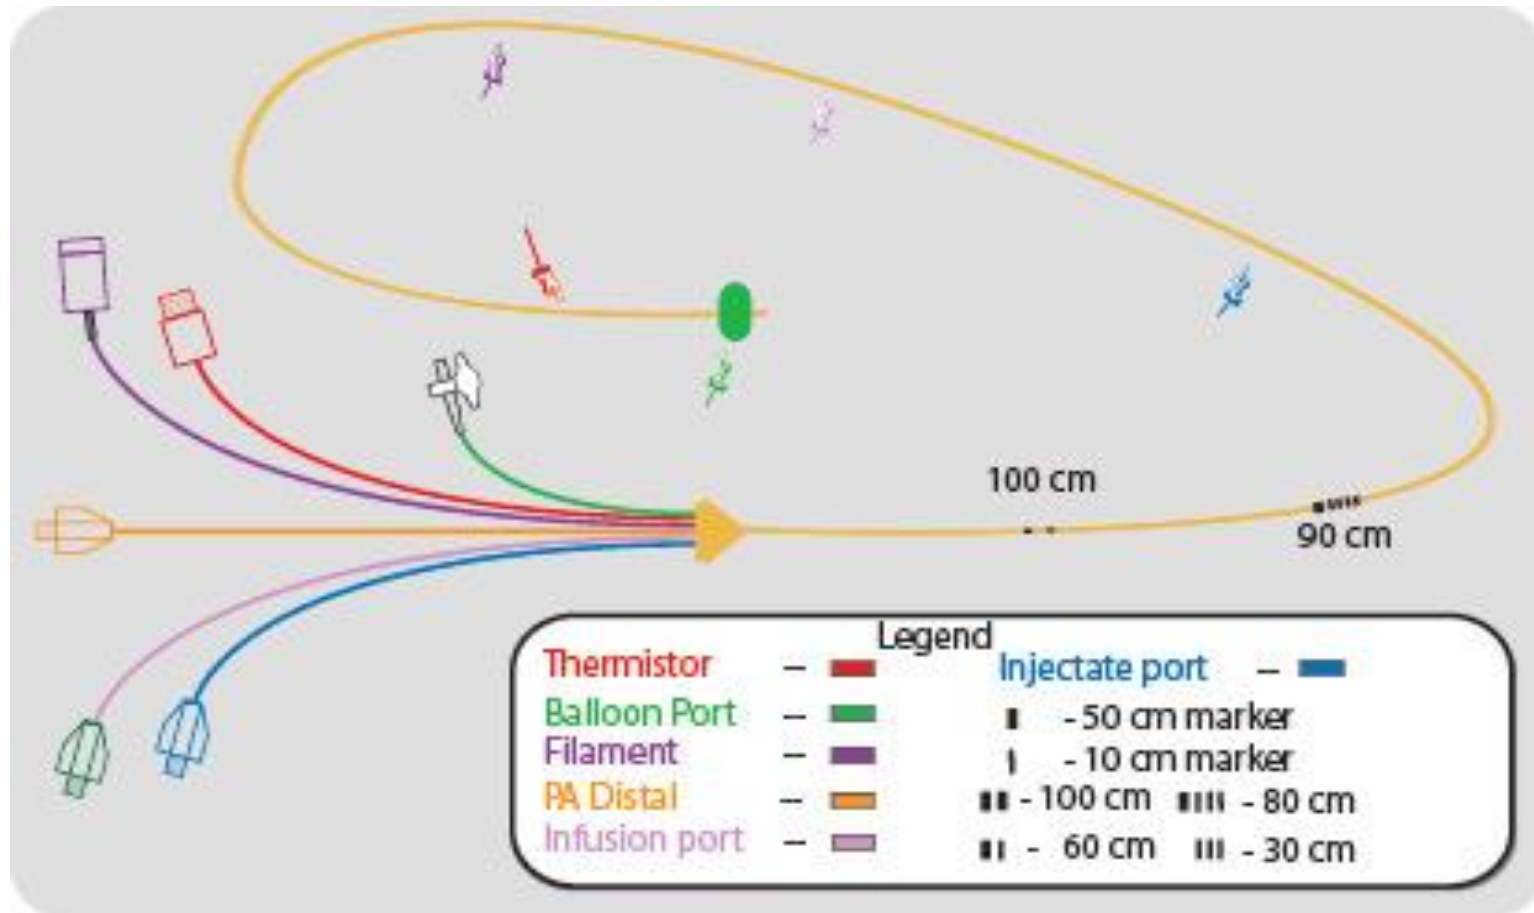

$$\dot{V}_O_2 = \text{Oxygen uptake} / \{ C_{A_{O_2}} - C_{V_{O_2}} \}$$

Spirometer

A spirometer

Swan-Ganz catheter

O₂ Fick Problem

- If pulmonary vein O₂ content = 200 ml O₂/L blood
- Pulmonary artery O₂ content = 160 ml O₂ /L blood
- Lungs add 400 ml O₂ /min
- What is cardiac output?
- Answer: $400/(200-160) = 10$ L/min

THE INDICATOR DILUTION PRINCIPLE

Indicator concentration

$$\text{Area} = \int_{t_2}^{t_1} dc \cdot dt$$

$$\text{Area} = \bar{C}^* (t_2 - t_1)$$

(Rectangular)

$$\bar{C} = \text{Area} / (t_2 - t_1)$$

$$\text{Cardiac output} = \frac{q}{C} X \frac{60}{\text{duration in seconds}}$$

Thermodilution Method Curve

$$\text{AREA} = \int_{t1}^{t2} dT \cdot dt$$

VENOUS RETURN

- Definition: Volume of blood returns to either the left side or right side of the heart per minute
- $VR = CO = \Delta P/R$
- $VR = (\text{Venous pressure} - \text{Rt. Atrial pressure}) / \text{resistance to venous return}$

Effect of Venous Valves

Effect of Venous Valves

(a) Contracted skeletal muscles

(b) Relaxed skeletal muscles

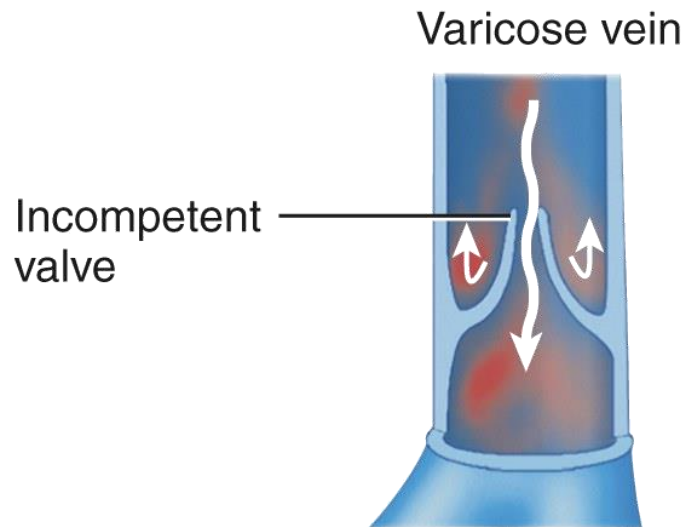

Venous Valves

Effect Of Gravity on Venous Pressure

Vessel Structure and Function

Dilated and twisted appearance of varicose veins in the leg

Venous Pressure in the Body

- Compressional factors tend to cause resistance to flow in large peripheral veins.
- Increases in right atrial pressure causes blood to back up into the venous system thereby increasing venous pressures.
- Abdominal pressures tend to increase venous pressures in the legs.

Central Venous Pressure

- ❖ Pressure in the right atrium is called *central venous pressure*.
- ❖ *Right atrial pressure* is determined by the balance of the heart pumping blood out of the right atrium and flow of blood from the large veins into the right atrium.
- ❖ Central venous pressure is normally 0 mmHg, but can be as high as 20-30 mmHg.

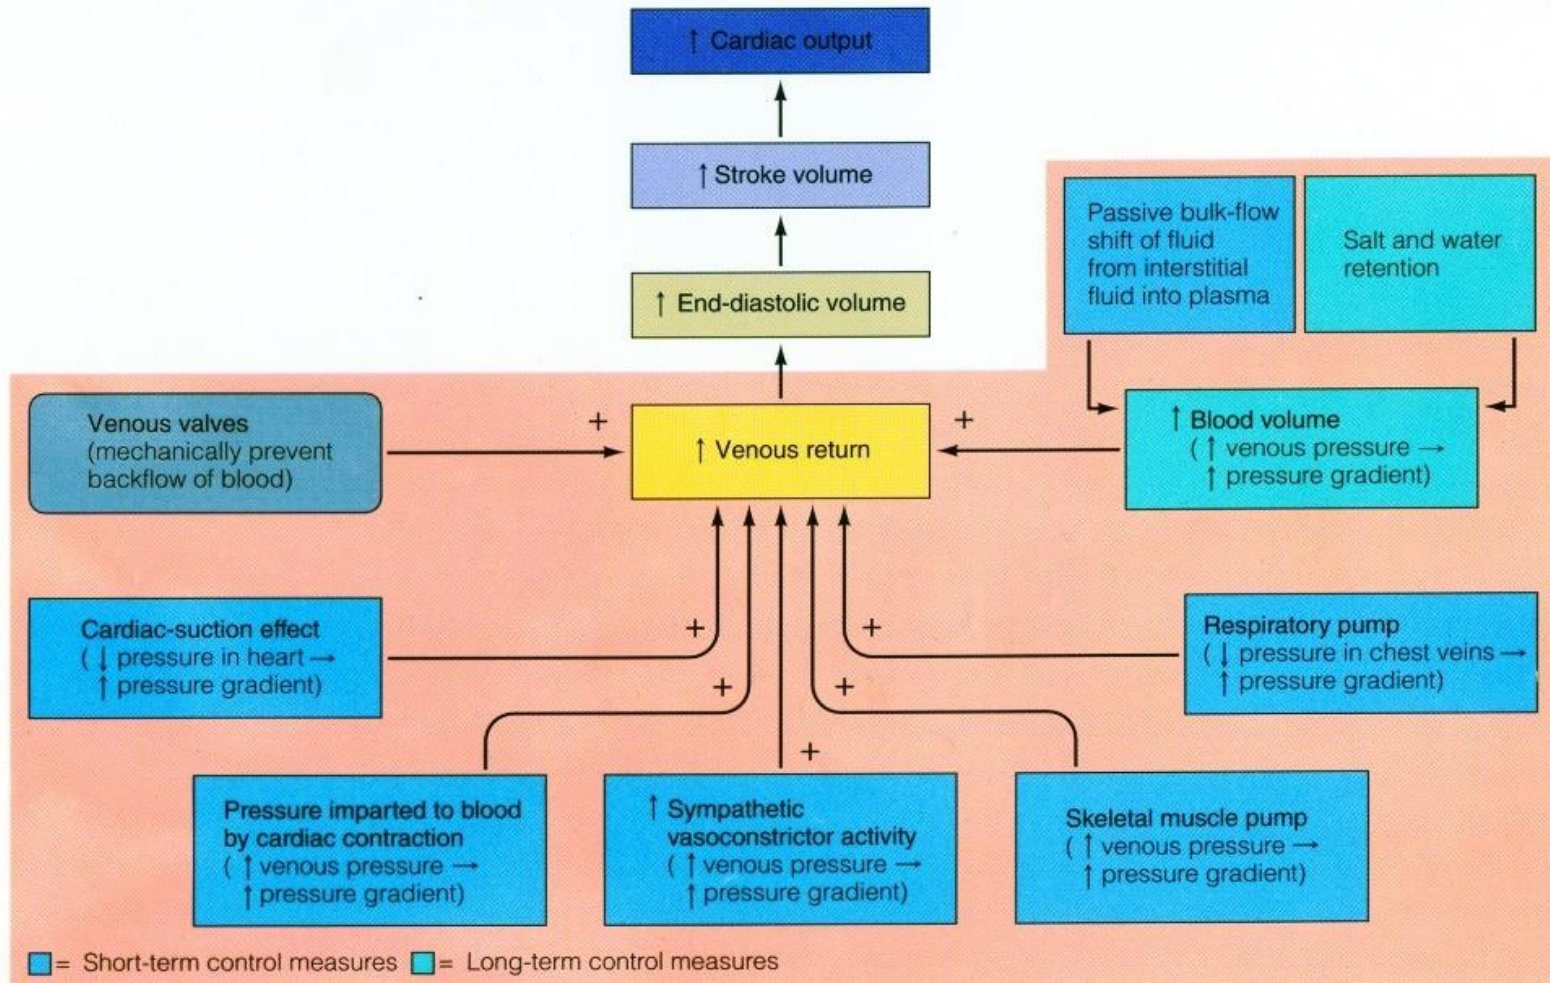

Factors affecting Central Venous Pressure

⚙️ Right atrial pressure (RAP) is regulated by a balance between the ability of the heart to pump blood out of the atrium and the rate of blood flowing into the atrium from peripheral veins.

- ⚙️ Factors that increase RAP:
- ⚙️ -increased blood volume
 - ⚙️ -increased venous tone
 - ⚙️ - dilation of arterioles
 - ⚙️ -decreased cardiac function

Factors that Facilitate Venous Return

The Venous Return Curve

Venous Return (VR)

- Beriberi - thiamine deficiency \Rightarrow arteriolar dilatation $\Rightarrow \downarrow$ RVR
- (RVR= resistance to venous return)
because $VR = (MSFP - RAP) / RVR$
(good for positive RAP's)
- A-V fistula \Rightarrow (? RVR)
- \downarrow RVR
- C. Hyperthyroidism \Rightarrow (? RVR)
- \downarrow RVR

Venous Return (VR) (cont'd)

- Anemia \Rightarrow \downarrow RVR (why?)
- Sympathetics \Rightarrow MSFP
- Blood volume \Rightarrow MSFP + small \downarrow in RVR
- \downarrow Venous compliance (muscle contraction or venous constriction) \Rightarrow (? MSFP)
- MSFP

Factors Causing ↓ Venous Return

- ↓ Blood volume \Rightarrow ↓ MSFP
- ↓ Sympathetics \Rightarrow (? v. comp. and MSFP)
- Venous compliance and ↓ MSFP
- Obstruction of veins \Rightarrow (? RVR)
- RVR

CARDIAC OUTPUT AND VENOUS RETURN (L/min/m)

Thank You
