

# Viral hemorrhagic fevers

## Arboviruses

Any virus that is transmitted by arthropod vectors, Such as:

1. Flaviviridae
2. Bunyaviridae (except Hantavirus)

## Structure

-Enveloped Lipid-encapsulated  
-All of them -sRNA (replicate in the cytoplasm) except Flaviviridae +sRNA (replicate in the nucleus)

## Common pathophysiology

Diffuse Damage to overall vascular system characterized by hemorrhage

## Transmission

-Zoonotic (animal-borne)  
-Geographically restricted by the host  
- Persistent in nature (rodents, bats, mosquitoes, ticks, monkeys )

# General features

## Reservoir

Rodents & Arthropods

## How do we get infected?

- 1.Rodents: inhalation or Contact with excreta
- 2.Arthropods (Bites of infected mosquito or tick)
- 3.person to person:  
Airborne potential for some arenaviridae, filoviridae

## Statistics

Ebola and Marburg have the highest mortality rate

## Interpersonal transmission route is well documented in:

1. Lassa Fever
2. Crimean Congo HF (CCHF)
3. Filoviridae (Marburg & Ebola)

	Transmission	Clinical features	Example
Arenaviridae	<ul style="list-style-type: none"> <li>Non-arboviruses.</li> <li>Rodent-borne.</li> <li>Virus transmission &amp; amplification occurs in <b>rodents</b> → then they shed virus through urine, feces, &amp; other excreta → Human infection</li> <li>How the human get infected?               <ol style="list-style-type: none"> <li>Contact with rodent's excreta</li> <li>Contaminated materials</li> <li><b>Person-to-person transmission (only in case lassa fever)</b></li> </ol> </li> </ul>	<ul style="list-style-type: none"> <li>Incubation period 10-14 days.</li> <li>Fever and malaise 2-4 days.</li> <li>Mild Hemorrhage in form of petechiae or purpura.</li> <li>Leukopenia &amp; thrombocytopenia</li> <li>Neurologic signs</li> </ul>	<p><b>Lassa Fever (west Africa)</b></p> <ul style="list-style-type: none"> <li>Highest mortality rate in this group</li> <li><b>Reservoir:</b> Rodent-borne (<i>Mastomys natalensis</i>)</li> <li>Can transmit from person to person (intrapersonal rout) via direct contact, sex, breastfeeding.</li> <li><b>Distinguishing clinical Features:</b> <ul style="list-style-type: none"> <li>Gradual onset</li> <li>Myocarditis → Retro-sternal pain</li> <li>Exudative pharyngitis</li> <li><b>Hearing loss</b> in 25% may be persistent</li> <li><b>Spontaneous abortion</b></li> </ul> </li> <li><b>Morphology under EM:</b> Sandy Cytoplasm</li> </ul>
Bunyaviridae	<ul style="list-style-type: none"> <li>Arthropod vector (arboviruses), except Hantaviruses.</li> <li>Contact with animal blood or products of infected livestock.</li> <li>Rodents (Hantavirus)</li> <li>Person-to-person transmission with CCHF</li> </ul>	<p><b>RNA morphology</b></p> <ul style="list-style-type: none"> <li>Have a segmented RNA:           <ol style="list-style-type: none"> <li><b>L segment:</b> codes for an L protein (the RNA dependent RNA polymerase)</li> <li><b>M segment:</b> codes for two surface glycoproteins G1 and G2 which form the envelope spikes</li> <li><b>S segment:</b> codes for an N-protein (nucleocapsid protein).</li> </ol> </li> </ul>	<p><b>Rift Valley Fever</b></p> <ul style="list-style-type: none"> <li>Mild illness in humans so usually asymptomatic</li> <li><b>Arthropod vector:</b> <i>Aedes</i> mosquito</li> <li><b>Distinguishing clinical Features:</b> <ul style="list-style-type: none"> <li>Hemorrhagic complications rare</li> <li><b>Vision loss</b> "blindness" due to retinal hemorrhage, vasculitis</li> </ul> </li> </ul> <p><b>Crimean-Congo Hemorrhagic Fever</b></p> <ul style="list-style-type: none"> <li><b>Arthropod vector:</b> Ixodid tick</li> <li><b>Distinguishing clinical Features:</b> <ul style="list-style-type: none"> <li>Abrupt (sudden) onset</li> <li>hemorrhagic fever + significant hemorrhagic complication</li> <li>Profuse hemorrhage (internally &amp; externally)</li> <li>May develop GI symptoms like hematemesis and melena</li> </ul> </li> </ul> <p><b>Hantaviruses</b></p> <ul style="list-style-type: none"> <li>Non-arboviruses</li> <li><b>Transmission:</b> Exposure to rodent saliva and excreta</li> <li><b>There are two serotypes of Hantaviruses:</b> <ol style="list-style-type: none"> <li>New-world Hantavirus → cause Hantavirus Pulmonary Syndrome (HPS)</li> <li>Old-world Hantavirus → Hemorrhagic Fever with Renal Syndrome (HFRS)</li> </ol> </li> <li><b>Distinguishing clinical Features of HFRS:</b> <ul style="list-style-type: none"> <li>Insidious onset</li> <li>Intense headaches</li> <li>Blurred vision</li> <li>kidney failure; causing severe fluid overload &amp; periorbital edema</li> </ul> </li> </ul>

	Transmission	Clinical features	Example
Flaviviridae	<ul style="list-style-type: none"> <li>Arthropod vector</li> </ul>	<ul style="list-style-type: none"> <li>Characterized by the “Biphasic clinical presentation”:               <ol style="list-style-type: none"> <li>Viremia phase: high viral load in the blood and high secretion of cytokines and constitutional signs and symptoms (marked fever)</li> <li>Toxemia phase: Fever returns along with the constitutional symptoms + Hemorrhagic signs and symptoms</li> </ol> <p>*In between the 2 phases, there is a window period, in which signs and symptoms disappear</p> <ul style="list-style-type: none"> <li>Yellow Fever and Dengue have two cycles:                   <ol style="list-style-type: none"> <li>Sylvatic cycle: The cycle between nonhuman primates and humans are considered accidental hosts</li> <li>Urban cycle: between humans and the vector without the need of an intermediate host</li> </ol> </li> </ul> </li> </ul>	<p><b>Yellow Fever</b></p> <ul style="list-style-type: none"> <li>Arthropod vector: <i>Aedes aegypti</i></li> <li>Distinguishing clinical Features:           <ul style="list-style-type: none"> <li>Common hepatic involvement &amp; jaundice (cause lytic necrosis of hepatocyte).</li> </ul> </li> </ul> <p><b>Dengue</b></p> <ul style="list-style-type: none"> <li>Arthropod vector: <i>Aedes aegypti</i></li> <li>3 levels:           <ol style="list-style-type: none"> <li>Dengue Fever ( Lowest Fatality)</li> <li>Dengue Hemorrhagic Fever</li> <li>Dengue Shock Syndrome (Highest Fatality)</li> </ol> </li> <li>Four distinct serotypes: DEN-1, DEN-2, DEN-3, DEN-4</li> <li>** The infection by one of these serotypes will develop a lifelong immunity for that serotype but if get infected later by another serotype the patient will develop a severe illness</li> <li>Distinguishing clinical Features:           <ul style="list-style-type: none"> <li>Sudden onset</li> <li>Eye pain</li> <li>Rash</li> <li>Arthralgia</li> <li>Illness is severe in younger children</li> </ul> </li> </ul> <p><b>Omsk Hemorrhagic Fever</b></p> <ul style="list-style-type: none"> <li>Reservoir: Muskrat</li> <li>Arthropod vector: <i>Dermacentor reticulatus</i> tick</li> <li>Distinguishing clinical Features:           <ul style="list-style-type: none"> <li>Acute onset</li> </ul> </li> <li>Complications           <ul style="list-style-type: none"> <li>Hearing loss</li> <li>Hair loss</li> <li>Psycho-behavioral difficulties</li> </ul> </li> </ul> <p><b>Kyasanur Forest</b></p> <ul style="list-style-type: none"> <li>Arthropod vector: <i>Ixodid tick (Haemaphysalis)</i></li> <li>Distinguishing clinical Features:           <ul style="list-style-type: none"> <li>Acute onset</li> </ul> </li> </ul>
Filoviridae	<ul style="list-style-type: none"> <li>Non-arboviruses</li> <li>Nosocomial transmission</li> <li>Aerosol transmission</li> <li>Reservoir is UNKNOWN (but it is zoonotic)</li> <li>Interpersonal transmission (Intimate contact)</li> </ul>	<ul style="list-style-type: none"> <li>Most severe hemorrhagic fever</li> <li>Incubation period: 4-10 days</li> <li>Aerosol transmission</li> <li>Abrupt onset</li> <li>Hemorrhage and DIC</li> <li>Death around day 7-11 (in the second week)</li> <li>Painful recovery; the patient does not feel that he is getting well.</li> <li>Filament like under EM</li> </ul>	<p><b>Ebola</b></p> <ul style="list-style-type: none"> <li>Five subtypes: Ebola-Zaire, Ebola-Sudan, Ebola-Ivory Coast, EbolaBundibugyo, <b>Ebola-Reston (illness in nonhuman primates / US)</b></li> <li>Human-infectious subtypes found only in Africa</li> <li>Distinguishing clinical Features:           <ul style="list-style-type: none"> <li>Acute onset</li> <li>GI involvement / Weight loss</li> </ul> </li> </ul> <p><b>Marburg</b></p> <ul style="list-style-type: none"> <li>Distinguishing clinical Features: Sudden onset/ chest pain/ Maculopapular rash on trunk/ Pancreatitis/ Jaundice</li> </ul>

## GENERAL INFORMATION

### COMMON PATHOPHYSIOLOGY

- Small vessel involvement (Increased vascular permeability)
- Multiple cytokine activation & Inadequate/delayed immune response
- Cellular damage
- Abnormal vascular regulation (mild hypotension in early stage)
- Viremia (Macrophage involvement)

### LAB STUDIES

- Complete Blood Count
- Liver enzymes
- Proteinuria universal
- Serological tests - Ab not detected acute phase
- EM specific and sensitive

### EARLY/PRODROMAL SYMPTOMS

- Flu-like symptoms
- Fever, Myalgia, Headache, ...
- Non-bloody diarrhea.
- Arthralgia

### PROGRESSIVE SIGNS

- Conjunctivitis, Periorbital edema
- Subconjunctival hemorrhage
- Ecchymosis, Petechiae
- But the hemorrhage itself is rarely lifethreatening.

### SEVERE/END-STAGE

- Multisystem compromise
- Profuse bleeding
- Consumptive coagulopathy & DIC mainly in Filoviridae
- Encephalopathy
- Shock
- Death

Treatment	Prevention	Vaccination
